

Identify regulation

User

could you help to identify that reg ?

Assistant

Looking at the four dashcam stills shared, two different vehicles with partially visible registration plates are visible:

Vehicle 1 — White coach/bus (images 1 and 3, rear view, camera C9): the yellow rear plate is visible but too motion-blurred and low-resolution to read with confidence. It's a standard UK yellow rear plate format, but the characters aren't legible enough for a reliable read.

Vehicle 2 — Silver/grey truck or lorry (images 2 and 4, front view through rainy windscreen, camera IP1): the front plate appears to read something close to FJ57 ??Z or similar — looks like a 2007-format UK plate (FJ57 prefix would suggest registration in Nottingham, Sept 2007–Feb 2008). The middle three letters are too blurred/raindrop-obscured to commit to a specific reading — might be FJ57 O EZ, FJ57 U EZ, or similar, genuinely uncertain.

Caveats: these are heavily compressed, motion-blurred, and (for the truck) shot through a rainy windscreen, so individual characters would be a guess. Better to say “can't read it cleanly” than give a wrong plate that sends things down the wrong path. If there's an original (uncompressed) video file or a sharper frame — especially closer or more stationary — that would help a lot. If this is for an insurance claim, accident report, or police matter, the original footage submitted to authorities would be far more useful than these stills.

What's the context — trying to identify one of these vehicles for a specific reason?

User

the white and yellow reg are the same. one is from the front and the other one is from the back

Assistant

Ah, that makes sense — the “coach” rear is actually the back of the same box-bodied lorry. Good catch. That gives two angles of the same plate to work with.

Even combining both views, still can't read it cleanly enough to commit to specific characters. What can be said with reasonable confidence:

- Format: UK 2007-style plate (two letters, two numbers, three letters)
- First four characters: FJ57 — clearest on the front (IP1) shot. FJ57 = registered in Nottingham between Sept 2007 and Feb 2008.
- Last three letters: stuck here. The front plate is obscured by raindrops, the rear yellow plate is motion-blurred. Something is visible in that space but it would be a guess — and a wrong guess on a reg plate is worse than no guess.

Things that would help: (1) the original video — even one extra frame where the vehicle is closer, or the camera is between bumps, often makes the difference between unreadable and readable; stills extracted from compressed video lose a lot; (2) a frame from when the lorry was being overtaken or pulled alongside — side-on plates aren't usually visible, but a closer rear shot before dust kicked up might be sharper; (3) if this is dashcam footage from the user's own vehicle, the device usually stores the raw file on an SD card, much higher quality than a screenshot.

What's the situation — incident being reported, or trying to track someone down for another reason? That would help suggest the right next step (e.g., for a UK incident, police can request a DVLA lookup with a partial plate + vehicle description + time/location, often enough on its own).
