

Pagination implementation

User

lets do the pagination now

Assistant

Five steps: `tmdb-api.ts` takes a `page` param, `interfaces.ts` gets optional pagination props, `templateMovieListPage` renders an `MUI Pagination`, and `homePage.tsx/upcomingMoviesPage.tsx` each track `page` in state and fold it into the react-query key so switching pages refetches (and caches) correctly. Diffs match your current source exactly — go through Discover first, test, then mirror it on Upcoming.

User

now I need to link the pagination to the arrows

Assistant

I checked your files — `homePage.tsx`, `upcomingMoviesPage.tsx`, `templateMovieListPage`, and `interfaces.ts` are already updated from the earlier tutorial, so only the header arrows were left disconnected. Added Steps 6–7 to the same tutorial file: `HeaderProps` gets `page/totalPages/onPageChange`, the two `IconButton`s get `onClick + disabled` (boundary-aware), and `templateMovieListPage` forwards those three props to `Header` alongside what it already sends to `Pagination` — so both controls stay in sync off the same state.
